

strength vs. diluted at

A: Zero Tolerance (ZT) should be used at the strongest strength that does not significantly damage leaves. This way there is a sure kill with no remaining pests. First test ZT on a branch or two. If there is no damage use full strength. If there is any damage add one pint water to two pints ZT and test. Most likely there will be no damage in the new test. If there is dilute with another pint of water.

Q: Diluted for all stages of growth?

A: Don't dilute if you don't have to.

Q: How close to harvest can ZT be used?

A: ZT can be applied five days before harvest. The oils will all evaporate over a four to five day period.

Q: Coverage- how much should be applied?

A: Spray all leaves and branches and places where pests might hide. The leaves have to be sprayed completely but not to where they are dripping wet.

Q: How long can ZT be stored?

A: ZT will last many months as long as it is stored in a cool, dark space with cap tightly sealed. Always shake well before use.

Q: Can the plant be dipped rather than sprayed?

A: Yes.

Q: For hydroponic systems, can it be used in a reservoir?

A: Rather than using it in a reservoir directly, shut the system off and water the medium with a solution of 1 part ZT and 2-3 parts water.

Q: How do I use ZT for mites?

A: Spray on Days 1, 4, and 7. Spray on day 1, wait 3 days and spray again Day

4) 2 days later spray again (Day 7). The mite infection will be eliminated.
